FREE PROMPT · BY SANDEEP KOMAL

BUILD A PORTFOLIO LIKE MINE

A prompt that recreates the style of **sandeepkomal.github.io**: a dark, animated portfolio with a 3D portrait that follows your cursor, a custom cursor, scroll animations, an interactive 3D diagram and a spinning project carousel. Fill in your details and let an AI coding tool build it for you.

1 **Fill in your details**

Add your name, projects and links in the "About me" part at the top of the prompt (page 2).

2 **Paste it into an AI coding tool**

Claude Code or Cursor work best, because they can create the project files for you. A chat assistant works too; you'll copy the files across yourself.

3 **Run it and go live**

Follow its steps to run the site on your computer, then publish it on GitHub Pages. Hosting there is free.

THE PROMPT

Copy everything in the box. Fill in the "About me" section before you send it.

```
Build me a personal portfolio website with a dark, premium and interactive feel.

ABOUT ME (fill this in)
- Name:
- Role / title:
- One-line tagline:
- About paragraph:
- Skills and tools, grouped by category:
- 3-6 projects: name, one-line description, tech used, live link, GitHub link, screenshot
- Journey / experience: 3-5 steps, each with a title and a short description
- Contact: email, GitHub, LinkedIn, any other links
- Photo or avatar of me (optional)

TECH STACK
React + TypeScript + Vite, Tailwind CSS, Framer Motion for animations, Three.js for 3D.
Static site that can be hosted for free on GitHub Pages.

DESIGN
- Near-black background (#0C0C0C)
- Headings in Kanit 900 (Google Fonts), uppercase, with a silver metallic gradient
- Accent gradient for buttons and highlights: purple #7621B0 → magenta #B600A8 → orange #BE4C00
- Huge section titles, generous spacing, mobile-first and fully responsive

SECTIONS, IN ORDER
1. Hero (full screen): huge "HI, I'M [NAME]" heading. Behind it, faint terminal commands from my field
fading in and out like live logs. My avatar at the bottom whose eyes follow the cursor (with a normal
photo, tilt it slightly toward the cursor instead). Tagline bottom-left. A gradient "Contact me"
button bottom-right that is magnetic: it pulls toward the cursor when it gets close.
2. Marquee: an endless horizontally scrolling row of my tools with their icons.
3. About: a paragraph that reveals word by word as you scroll, small highlight cards, and a few
floating 3D shapes in the background.
4. Stack: numbered skill categories (01, 02, 03…), each fading in as it scrolls into view.
5. How I work: an interactive 3D diagram (Three.js) of my workflow, with nodes joined by lines and
particles flowing along them. Nodes glow and show a label on hover.
6. Projects: a 3D carousel of glass-style cards standing round a slowly turning cylinder. Drag or
swipe to spin it with inertia, arrows to step card by card, pauses on hover. Each card shows a
screenshot, title, description, tech tags and Live / GitHub buttons.
7. Journey: a vertical timeline with numbered steps.
8. Contact: a big "LET'S CONNECT" heading, a short line, and pill-shaped link buttons (Email, GitHub,
LinkedIn…) that invert colours on hover.

EFFECTS ACROSS THE SITE
- Custom cursor on mouse/trackpad devices only: a small arrow with a trailing ring that grows over
links and buttons, leaving a short trail of tiny pixel particles in the accent colours that burst on
click.
- Every section fades and slides up into view as you scroll.
- Respect "prefers-reduced-motion" by turning off heavy motion for people who ask for it.
- Pause 3D rendering when a canvas is off screen, lazy-load images, keep it smooth on a normal laptop.
- On phones, hide the custom cursor and make everything tappable and swipeable.

HOW TO DELIVER IT
- Keep all my text, links and projects in one file (src/content.ts) so I can edit them without
touching the components.
- Work step by step: project setup and the content file first, then one section at a time, then the
effects, then deployment.
- Show me how to run it locally (npm install, npm run dev) and how to deploy it to GitHub Pages with a
GitHub Actions workflow.
- Before you start, ask me for any details I haven't filled in.
```

TIPS FOR A GREAT RESULT

- **Go one section at a time.** Check each section in the browser before asking for the next one. It's much easier to fix things early.
- **Make it yours.** Swap the colours in the DESIGN part for your own, and replace the terminal commands in the hero with ones from your own field.
- **No avatar?** Use a clean photo of yourself. The prompt already tells the AI to tilt it toward the cursor instead of moving the eyes.
- **If something breaks,** paste the exact error message back into the AI and ask it to fix it.
- **Check it on your phone** before you share the link. Most people will open it on mobile.
- **Show me what you build!** Tag me on Instagram. I'd love to see it.

FOUND THIS USEFUL?

Good to know: what you get depends on the AI tool you use, and it usually takes some back-and-forth to get everything right. GitHub Pages hosting is free, but some AI coding tools need a paid plan. Tool names are mentioned only as suggestions; this guide isn't affiliated with any of them.
